Modelling Undirected Graphs

• Dynamic Stochastic Blockmodel:

$$A_t(i,j) = \begin{cases} \text{Bernoulli}(P_t(i,j)), & \text{if } i < j \\ 0, & \text{if } i = j \\ A_t(j,i), & \text{if } i > j \end{cases}$$
(1)

$$\mathcal{A}_t := \mathbb{E}(\mathcal{A}_t | Z_t) = Z_t \mathcal{B}_t Z_t^{\top}, \qquad (2)$$

where $Z_t \in \{0,1\}^{N \times K}$ is the *clustering matrix* such that there is only one 1 in each row and at least one 1 in each column.

• Node Covariates:

• Regularized Graph Laplacian:

$$L_{\tau,t} = D_{\tau,t}^{-1/2} A_t D_{\tau,t}^{-1/2}, \tag{3}$$

where $D_{\tau,t} = D_t + \tau_t I$ and D is a diagonal matrix with $D_t(i,i) = \sum_{j=1}^N A_t(i,j)$, and $\tau_t = N^{-1} \sum_{i=1}^N D_t(i,i)$.

• Similarity Matrices (Covariate-assisted Graph Laplacian):

$$S_t = L_{\tau,t} + \alpha_t X X^\top.$$
(4)

where $\alpha_t \in [0,\infty)$ is a tuning parameter

Empirical Results

Asset Pricing Inference: Hypothesis Development

- Rational Price: Information Diffusion
 - Within Group Return Predictability
 - Lead-Lag Effects across Groups
- Behavior Bias: Overreaction.
 - **Time Series Return Predictability**: Stronger return predictability of lagged return for groups with low centrality than high centrality groups.
 - Cross Sectional Return Predictability: Contrarian strategy should be more profitable for those groups with lower centrality score.

Cross Sectional Return predictability Compa

• Covariate-assisted Spectral Clustering is useful to Understand Cryptocurrency Market Structure.

- 1. Attribution Matrix provides most valuable information to connect within group members.
- 2. Return based adjacency matrix reveal connections across different groups.
- 3. Within group connection is stronger than cross group connection.
- 4. Behavior bias is stronger for those groups with low market centrality.
 - a. Time Series Return Predictability based on lagged return shows high $\Delta \textit{CSFE}$ for groups with low centrality.
 - b. Contrarian strategy reveal higher investment value for the low centrality groups than the high centrality groups.
